

City of Manhattan Beach *(May 2015)*

MR312.04 – Marine Ave at Sepulveda Blvd – This project widened the existing roadway along Marine Ave at Sepulveda Blvd to provide an additional westbound left-turn lane. The purpose of this project is to improve the Level of Service of the intersection of Sepulveda Boulevard. Traffic delay and queuing occurrences at the intersection will be reduced and efficiency of the arterial system will be improved. This will improve regional mobility and reduce congestion for fixed-route transit and truck traffic and improve access to intermodal transportation systems, such as the airport and rail station. Constructing the intersection and traffic signal improvements will provide increased traffic capacity for vehicles to utilize the arterial system and reduce congestion during peak hours for turning vehicles that typically obstruct through traffic.
