## Appendix B: Port Cargo Facilities

## Port of Los Angeles On-Site Cargo Facilities

The POLA comprises 4,200 acres of land and has eight container terminals (1,686 acres) and four dockside intermodal rail yards. In addition, the port has eight liquid bulk terminals, one automobile terminal, three break bulk terminals, and three dry bulk terminals.

## Automobile Terminal

Wallenius Wilhelmsen Logistics operates a vehicle processing and logistics service on 85 acres at berths 195-199. There is a storage capacity of 8000 vehicles, and a rail yard for loading and unloading auto racks. Customers include Nissan, Infiniti, and Nissan Diesel.

## Breakbulk Terminals

Handling nearly three million tons of breakbulk cargo per year with three dedicated breakbulk facilities, POLA is a major West Coast steel port. Berths 49 to 53 and its 24 acres are used for breakbulk and steel. There is on-dock rail access. Berths 54 and 55 and its 12 acres are used for the import of meats. Chilean fruit, kiwis, and apples. Berths 174 to 181 and its 40 acres are used for steel. The property includes three cranes with 40-ton capacity, covered on-dock warehouses, and specialized on-dock rail service for steel.

## Container Terminals

POLA has eight major container terminals and four dockside intermodal rail yards with direct access to the Alameda Corridor. In total there are 30 berths and 1,686 acres of container terminals at POLA.

## Dry Bulk Terminals

Four berths and 154 acres of the POLA is dedicated to dry bulk. The only privately held facility at POLA, the Borax Terminal, transfers cargo to vessels at a rate up to 1,000 metric tons per hour. The two other dry bulk operators handle all grades of ferrous and non-ferrous scrap metals and petroleum coke.

## Liquid Bulk Terminals

POLA has eight liquid bulk facilities on 114 acres that handle various types of commodities for both import and export. Handling facilities include tankers, barges, bulk carriers, and storage tanks with adjacent rail access.

## Warehousing and Distribution

POLA has 13 acres of on-site warehouse facilities at four berths. These berths are adjacent to rail facilities.

## Port of Long Beach On-Site Cargo Facilities

POLB comprises 3,230 acres of land with seven container terminals and five dockside intermodal rail terminals. The port also has seven dry bulk terminals, seven liquid bulk terminals, ten break-bulk terminals, and one automobile terminal.

Automobile Terminal
Toyota operates an automobile terminal at Pier B, berths 82 and 83. It is a total of 151 acres.

## Breakbulk Terminals

Ten breakbulk terminals are located on over sixty acres of Piers D and F. Commodities include general break bulk and steel.

## Container Terminals

POLB has seven container terminals on a total of 1,284 acres with five on-dock intermodal rail terminals.

## Dry Bulk Terminals

POLB has seven dry bulk terminals on over 130 acres of Piers B, D, G, F, and T.
Commodities include scrap metal, lumber, gypsum, cement, salt, sulfur, and petroleum coke.

## Liquid Bulk Terminals

POLB has seven liquid bulk facilities on over fifty acres of Piers B, D, F, and S. Commodities include gasoline, gasoline blending stocks, diesel, naptha jet fuel, crude oil, bunker fuel and other petroleum products.

## Appendix C: California Vehicle Code Sections Pertaining to Trucks

For associated text, refer to Section 2.1.5

The California Vehicle Code (CVC) is the state level legislation that regulates trucks and the types of truck restrictions that can be implemented by local jurisdictions. The vehicle code does not regulate truck parking, which is left to the local jurisdictions to legislate and enforce. Excerpts from relevant sections of the vehicle code are listed below, and other State, Federal and local ordinances and regulations are described later in this chapter.
CVC Section 22406
"No person may drive any of the following vehicles on a highway at a speed in excess of 55 miles per hour: (a) A motortruck or truck tractor having three or more axles or any motortruck or truck tractor drawing any other vehicle..."

CVC Section 21655
(b) "Any ... vehicle subject to the provisions of Section 22406 shall be driven in the lane or lanes designated ... whenever signs have been erected... . ..., when a specific lane or lanes have not been so designated, ... those vehicles shall be driven in the right-hand lane for traffic or as close as practicable to the right edge or curb. If, however, a specific lane or lanes have not been designated on a divided highway having four or more clearly marked lanes for traffic in one direction, ... those vehicles may also be driven in the lane to the immediate left of that right-hand lane, ... When overtaking and passing another vehicle proceeding in the same direction, the driver shall use either the designated lane, the lane to the immediate left of the right-hand lane, or the right-hand lane for traffic ... This subdivision does not apply to a driver who is preparing for a left- or right-hand turn or who is entering into or exiting from a highway or to a driver who must ... drive in a lane other than the right-hand lane to continue on his or her intended route."

CVC Section 21654
(a) "..., any vehicle proceeding upon a highway at a speed less than the normal speed of traffic moving in the same direction ... shall be driven in the right-hand lane for traffic or as close as practicable to the right-hand edge or curb, except when overtaking and passing another vehicle proceeding in the same direction or when preparing for a left turn at an intersection or into a private road or driveway."

CVC Section 35700
(a) "The legislative body of any county or city may by ordinance permit the operation and moving of vehicles and loads upon highways under their respective jurisdictions of a maximum gross weight in excess of the maximum gross weight of vehicles and loads specified in this code." (b) This section does not apply to state highways".

## CVC Section 35701

(a) "Any city, or county for a residence district, may, by ordinance, prohibit the use of a street by any commercial vehicle or by any vehicle exceeding a maximum gross weight limit, except with respect to any vehicle which is subject to Sections 1031 to 1036, inclusive, of the Public Utilities Code, and except with respect to vehicles used for the collection and transportation of garbage, rubbish, or refuse ..." (b) The ordinance shall not be effective until appropriate signs are erected indicating either the
streets affected by the ordinance or the streets not affected, as the local authority determines will best serve to give notice of the ordinance. (c) No ordinance adopted pursuant to this section after November 10, 1969, shall apply to any state highway which is included in the National System of Interstate and Defense Highways, except an ordinance that has been approved by a two-thirds vote of the California Transportation Commission".

CVC Section 35703
"No ordinance adopted pursuant to Section 35701 shall prohibit any commercial vehicles coming from an unrestricted street having ingress and egress by direct route to and from a restricted street when necessary for the purpose of making pickups or deliveries of goods, wares, and merchandise from or to any building or structure located on the restricted street or for the purpose of delivering materials to be used in the actual and bona fide repair, alteration, remodeling, or construction of any building or structure upon the restricted street for which a building permit has previously been obtained".

CVC Section 35707
"Boards of supervisors in their respective counties may by ordinance reduce the permissible weights upon improved highways only which by reason of deterioration will be destroyed unless the weight limits are reduced, but no such reduction shall extend for a period of more than 90 days unless actual repair of the highway is begun within that time and thereafter continuously carried on to completion".

CVC Section 35712
(a) "Any county may, by ordinance, prohibit the use of any highway located in an unincorporated residential or subdivision area by any commercial vehicle exceeding a gross weight of 14,000 pounds. (b) Any county of the third class, as defined by Section 28024 of the Government Code, or of the ninth class, as defined by Section 28030 of the Government Code, may, by ordinance, prohibit the use of any highway located in an unincorporated residential or subdivision area by any commercial vehicle exceeding a gross weight of 5,000 pounds".

In summary, the Vehicle Code provisions provide for the following:

- Trucks are restricted to a 55 mile per hour speed limit
- Trucks are restricted to the two rightmost lanes unless otherwise designated
- Cities and counties may restrict the movement of vehicles over a maximum gross weight limit in residential districts, provided that appropriate signs are erected.
- Cities and Counties may not prohibit trucks from operating on any street when necessary for the purpose of making pickups or deliveries of goods.
- Counties may not restrict trucks on improved County highways unless to prohibit deterioration of such street (unless in a residential district).

## Appendix D: Federal and State Truck Routes

For associated text, refer to Section 2.1.6
In 1982, the federal government passed the Surface Transportation Assistance Act (STAA). This act required states to allow larger trucks on the "National Network," (NN) which is comprised of the Interstate system plus the non-Interstate Federal-aid Primary System. In 1983 and 1986 the California legislature passed bills that designated a "California Legal" truck that had different dimensions than the trucks allowed on the National Network, these trucks may use the designated California Legal network.

STAA trucks are limited to the National Network, Terminal Access routes, and Service Access routes (STAA Network). "California Legal" trucks can use the STAA Network and California Legal routes. The route classifications in California are as follows:

National Network (Federal): The National Network (NN) is primarily comprised of the National System of Interstate and Defense Highways, for example I-110, I-405, and I105. STAA trucks are allowed on the NN.

Terminal Access (State, Local): Terminal Access (TA) routes are portions of State routes, or local roads, that can accommodate STAA trucks. TA routes allow STAA trucks to (1) travel between NN routes, (2) reach a truck's operating facility, or (3) reach a facility where freight originates, terminates, or is handled in the transportation process.

Service Access (State, Local): STAA trucks may exit the National Network to access those highways that provide reasonable access to terminals and facilities for purposes limited to fuel, food, lodging, and repair, when that access is consistent with safe operation. The facility must be within one road mile of an exit from the National Network and that exit must be identified by signage.

California Legal (State): California Legal routes are state routes that allow California Legal-size trucks. STAA trucks are not allowed on these routes because of limiting geometrics, such as sharp curves and/or lack of turn-around space.

California Legal - Advisory (State): California law allows regulatory prohibition of a 38foot kingpin to rear axle (KPRA) or greater where posted in black-on-white. However, many California Legal routes cannot safely accommodate California Legal-size trucks with a KPRA less then 38 feet, due to limiting geometrics such as sharp turns and roadway width. Although California Legal trucks may travel on these segments, the driver is still legally responsible for unsafe offtracking, such as crossing the centerline or driving on shoulders, curbs and sidewalks.

Special Restrictions (Federal, State, Local): Some route segments have special restrictions on certain trucks or loads, such as gross weight, number of axles, or hauling of flammable materials or explosives. For vehicles complying with the restrictions (for example, vehicles not carrying explosives), the route classification, in most cases, reverts back to that of the adjacent route segments.

## Appendix E: Detailed Intra-Subregional Rail System Description

## Pacific Harbor Line

Pacific Harbor Line (PHL) operates roughly 59 miles of track spread over an 18 -mile network serving the ports and nearby facilities. While PHL's best known function is serving the numerous on-dock intermodal terminals the line also handles roughly 40,000 carloads of conventional freight for industrial customers and non-container marine terminals.

The PHL Network

PHL is an operating unit of Anacostia \& Pacific, which owns and operates several shortline railroads. PHL connects with UP and BNSF's Harbor Subdivision at West Thenard, and with UP at Manuel Yard. West Thenard is also PHL's connection to the Alameda Corridor. I is primarily a switching railroad and its operations are restricted to $15-25 \mathrm{mph}$. As of early 2007, PHL had about 145 employees and 23 locomotives. PHL serves all of the nine on-dock rail transfer facilities at Los Angeles and Long Beach:

## Los Angeles

- Pier 400 (Maersk)
- Global Gateway South (APL)
- TICTF (NYK Evergreen)
- WBCT (Yang Min, China Shipping)

## Long Beach

- Pier J (Pacific Container Terminal)
- Pier G 9BCT)
- Cal United
- MSC
- Hanji

PHL provides switching services for these facilities and dispatches (controls) BNSF and UP trains providing line haul service. In addition to operating its own trains, PHL controls the operation of BNSF and UP intermodal trains over the PHL trackage to and from ondock terminals.

PHL's less-known carload operations are a critical factor in minimizing truck trips and truck impacts in the South Bay Cities subregion. The boxcars, flat cars, tank cars, hoppers, and other conventional railcars moved to and from industrial customers
typically each carry 50 to 100 tons of freight, the equivalent of two to four truckloads. PHL's 40,000 annual carloads thus take the place of $80,000-160,000$ annual round trips by heavy duty trucks on regional highways and surface streets.

PHL non-port customers include:

- Amerigas
- California Cartage
- Certainteed Roofing
- Conoco Phillips
- Del Monte
- Fremont Forest Products
- Hugo Neu (Scrap metal)
- Log Angeles Grain
- Lexus
- Nissan
- Pacific Coast Recycling
- Potential Industries
- Shell
- U.S. Borax
- Westway Terminals

PHL maintains its locomotive fleet on-site at shops in Wilmington. The current fleet of diesel locomotives is being gradually replaced with 16 EPA Tier 2-compliant locomotives being jointly funded by PHL, SCAQMD, and the seaports. PHL is also testing hybrid and generator set locomotives for low-emission switching service. PHL has joined all of the major North American railroad systems as a member of EPS's Smart Way program to benchmark and improve environmental performance.

## UP South Bay Freight Operations

The Union Pacific Railroad has three rail lines in the study area used to handle local freight traffic: the El Segundo Industrial Lead, the Torrance Industrial Lead, and the Wilmington Subdivision. However, the Alameda Corridor is used to move local freight to and from industry tracks located near the southern end of the Wilmington Subdivision.

Table 14
UP South Bay Freight Lines

| Line Name | Start | End | Length <br> (miles) |
| :--- | :--- | :--- | ---: |
| Wilmington Subdivision | West Redondo | Alameda | 11.7 |
| EI Segundo Industrial Lead | Watts | El Segundo | 10.8 |
| Torrance Industrial Lead | South L.A. | Torrance | 9.9 |
| Alameda Corridor | East Redondo | West Thenard | 16.1 |

UP Branch Lines in the Study Area

The easternmost line on the map, outside of the study area, is the San Pedro Branch, an alternative route to the Alameda Corridor. It is owned by the Port of Long Beach and leased to UP for operations. It is used by UP for local traffic as well as an alternate route should there be a problem on the Corridor.

Trains serving the local shippers on the study area rail lines originate at the UP $4^{\text {th }}$ Street Yard, located in central Los Angeles between Olympic Blvd and $1^{\text {st }}$ Street on the east side of the Los Angeles River. Traffic for the study area is brought to the $4^{\text {th }}$ Street Yard on trains that originate in West Colton. These trains handle non-unit train carload freight to and from the Los Angeles basin. They operate seven days per week with 30 to 50 cars per train.

## Wilmington Subdivision

The Willington Subdivision starts at West Redondo Junction (E 24th Street between Long Beach Avenue \& South Alameda Street) and ends at Alameda Junction (south of East Victoria Street and South Alameda Street), a distance of 11.7 miles. The El Segundo Industrial Lead diverges from the Wilmington Subdivision at approximately East 103 Street and Grandee Avenue. The right of way for the Wilmington Subdivision is shared with the Metro Blue Line from West Redondo Junction to and beyond the junction with the Alameda Corridor. The trackage south of Watts is not used for freight operation, except to stage empty double stack intermodal cars on the sidings at Carson mile post 7.3 and Nadeau mile post 2.0 for delivery to either the ICTF or on-dock intermodal terminals. Any carload freight for points south of Watts is
handled on the Alameda Corridor to Delores Yard for delivery by local trains out of that yard.

## El Segundo Industrial Lead

The El Segundo Industrial lead originates at Watts, mile post 5.7 on the Wilmington Subdivision, and ends at the Chevron Manhattan Beach Refinery.

UP El Segundo Industrial Lead

The three largest customers on this line are Interplastic Corporation, Vought Aircraft Industries, and Chevron. There is also a team track ${ }^{1}$ used to transfer lumber from railcars to truck for local delivery. While there are other receivers on the line, they have very infrequent freight and the three customers identified along with the team track account for the vast majority of traffic on the line.

The El Segundo Industrial branches off the Wilmington Subdivision Mainline at 108th Street. This line is 10.8 miles long and is served by one local train per day, Tuesday through Saturday, from the UP $4^{\text {th }}$ Street Yard.

The local train crews go on duty at 8:00 a.m. and work until the freight is delivered, with planned return to the yard by 4:00 p.m. A typical train consists of 20 cars with mostly loads inbound and empties outbound. The train sets out loads and picks up empties as it makes the round trip. Annual carload volume on the line is approximately 10,000 total loads and empties. The east end of the El Segundo Industrial Lead runs through residential areas.

El Segundo Industrial Lead at 109th Street

Interplastic Corporation at $126^{\text {th }}$ St and Van Ness produces Silmar brand polyester coating resins and related industrial products. These resins are used in production of fiberglass reinforced plastics (FRP) and cast polymers across a variety of industries and products - including furniture, machinery, and surfboards.

Interplastic Corporation at $\mathbf{1 2 6}^{\text {th }}$ St and S Van Ness

Vought Aircraft Industries is an unusual rail customer. Rather than handling bulk commodities Vought builds high-tech fuselage sections for the Boeing 747. The fuselage sections are shipped in specialized railcars to the Boeing assembly plant outside Seattle, where they are joined into a complete fuselage.

Specialized Railcars staged at Vought Aircraft

Each 154-foot 747 fuselage is shipped in 21 panels contained in six railcars, and assembled at Boeing outside of Seattle. Vought also builds portions of the Boeing 767 fuselage and components for the C-41 military transport at the Hawthorne plant.

## El Segundo Industrial Lead Line

The BNSF mainline and the UP El Segundo industrial lead line cross just east of Douglas Street at Utah Avenue.

UP \& BNSF crossing Douglas St. north of Utah

BNSF \& UP at Douglas Street

The El Segundo Industrial Lead also serves a team track west of Douglas St used to unload lumber.

El Segundo Local with Lumber for Team Track

The Chevron Manhattan Beach Refinery is served by both UP and BNSF for line haul and operates its own switch engine within the refinery. Chevron, located at the very end of the line, ships and receives four to six tank cars per day in each direction. This refinery receives crude petroleum by vessel and pipeline, and ships refined products. Among other products, this refinery provides roughly 20 percent of California's gasoline supply. The refinery also receives additives and other product components that it does not manufacture. Ethanol for blending into gasoline is a major source of traffic growth on this line.

This rail service is a key factor in controlling the number of tank trucks moving on local streets and regional highways with hazardous chemicals: each tank car is equivalent to three to four tank trucks.

Leading into the junction, the two railroad's lines parallel one another for approximately 0.75 miles from where they cross at Douglas Street. BNSF joins with the UP line to enter the refinery just east of Sepulveda Boulevard and a single line crosses Sepulveda Boulevard at grade into the refinery approximately 300 yards north of Rosecrans Avenue. The trackage is owned by UP and open to BNSF service.

North of the track and east of Sepulveda a new retail shopping center, Plaza El Segundo, is under construction. Given the location of the two lines and the retail activity in the area, the potential for congestion and rail/highway conflicts will increase. This highway-rail crossing was cited by the City of El Segundo as an at-grade freight rail crossings that creates significant motorist delay in the survey of South Bay Cities conducted as part of this study (see Section 3).

This location warrants further study for a potential grade-separated crossing. However, because grade separations need a significant amount of lead distance for an overpass or underpass, the proximities of rail loading/unloading facilities, the intersection of

Rosecrans Avenue with Sepulveda Boulevard, and access points to the new shopping center limit the design configuration options.

There is also an opportunity for consolidation of these tracks east of Douglas Street.

Tank Cars for Chevron on the El Segundo Local

Torrance Industrial Lead
The Torrance Industrial Lead is a 9.9 mile north-south rail line diverging from the El Segundo Industrial Lead at mile post 493 at the UP South Los Angeles station.

Torrance Industrial Lead

The station is two miles west from the point where the El Segundo Industrial Lead branches off from the Wilmington Subdivision. There is one local train per day Monday through Friday working the Torrance Industrial Lead. The local train originates at UP's $4^{\text {th }}$ Street Yard, as does the El Segundo local, but the Torrance crew starts work at 5:00 a.m. rather than 8:00 a.m. The local on a typical day has 16 to 18 loaded cars when it leaves $4^{\text {th }}$ St. Yard, most of the outbound cars from the line are empties. Annual carload volume on the line is slightly less than that of the El Segundo Industrial at approximately 9,000 loaded and empty cars.

The Torrance Industrial Lead originates in a tunnel under I-105 at South Broadway; and the Torrance and El Segundo Leads diverge beyond the freeway.

El Segundo \& Torrance Industrial Leads at South Broadway looking west
Conoco Phillips is the largest customer on the lead, receiving ten tank cars of ethanol each day for blending into gasoline for local delivery. Jones Chemical and Crenshaw Lumber each receive three to four railcars per day. Jones Chemical receives chemicals to produce industrial bleach and bisulfite products for water and wastewater treatment.
The Torrance Industrial Lead operates in the median of Vermont Avenue between approximately 152nd Street and Gardena Boulevard, where it runs in the street to 165th Street.

Looking south on Vermont Ave at $164^{\text {th }}$ St
Between Vermont Avenue and Normandie Avenue the Torrance Industrial continues street running on $166^{\text {th }} \mathrm{St}$. There is one business lead off the Industrial Lead prior to Normandie Avenue, Crenshaw Lumber which is west of Western Ave and south of $166^{\text {th }}$ St. Crenshaw Lumber receives railcar shipments of lumber for warehousing and eventual local distribution. Farther south, the Torrance Industrial Lead runs parallel to Normandie Avenue.

Torrance Industrial Lead at $\mathbf{2 0 4}^{\text {th }}$ Street paralleling Normandie Avenue

The rail line that crosses Normandie at $204^{\text {th }}$ Street is a business track serving a tank car customer located at Knox Street.

Jones Chemical (JCI) is west of the line at 1401 Del Amo Boulevard in Torrance. JCl produces water treatment chemicals and receives inbound materials in tank cars. Most product is shipped out in tank trailers, but JCl can ship outbound chemical in rail cars as well.

Jones Chemical Tank Trailer Shipments

The Torrance Industrial Lead operates in the median of Torrance Blvd between $208^{\text {th }}$ Street and Van Ness Avenue where it crosses Torrance Blvd paralleling Sartori Avenue to the end of the Lead at U. S. Gypsum. The U.S. Gypsum plant produces drywall joint compound and related building products.

Torrance Industrial in median of Torrance Blvd at Van Ness Ave

Torrance Industrial Lead near the end of the line west of Van Ness Ave at $208^{\text {th }}$ St

U. S. Gypsum on both sides of Van Ness Ave rail line at end of line

## BNSF Local Freight Operations

BNSF has one line in the South Bay Study area, the Harbor Subdivision Main Line (Harbor Line), with several industry lead tracks. The route was clearly chosen to serve the El Segundo refinery, the seaports, and industrial customers in between.

BNSF Harbor Subdivision

The Harbor Line starts in Los Angeles in the vicinity of Washington Boulevard and the Los Angeles River at Harbor Junction running generally south toward the port area for 27.6 miles and ending at West Thenard on the Alameda Corridor.

From the origin the line heads south to approximately $56^{\text {th }} \mathrm{St}$, then runs west paralleling Slauson Ave to approximately Western Ave where it turns southwest adjacent to Florence Ave. At Aviation Blvd the line turns south and runs parallel to the road on the eastern edge of LAX, crossing Imperial Highway, at grade, to El Segundo Boulevard. The grade crossing at Imperial Highway and Aviation Boulevard has been identified by communities as a source of delay or congestion.

BNSF Grade Crossing at Imperial \& Aviation

BNSF Crossing on Imperial Highway
After crossing El Segundo Boulevard, the Harbor Line heads southwest crossing the UP El Segundo Industrial Lead at approximately Douglas Street where the BNSF industry
lead to the Chevron Refinery branches of the main. The Douglas/Utah grade crossing has also been identified a causing significant motorist delay.

The BNSF Harbor Subdivision joins again with the UP El Segundo line just east of Sepulveda Blvd before the UP line enters the refinery. See the description of the UP local rail services for a description of this location.

The Harbor Line turns southeast at the point where the industry lead to Chevron joins with the main line crossing Rosecrans Avenue at Aviation Boulevard. The line continues southeast parallel to l-405 to Manhattan Beach Boulevard where it turns south paralleling Condon Avenue one block east of Inglewood Avenue to approximately $182^{\text {nd }}$ Street. BNSF crosses both Inglewood and Manhattan Beach Boulevard on a diagonal, making it possible for a train to block both streets at once.

BNSF Inglewood and Manhattan Beach Grade Crossings

Harbor Line Crossing Inglewood north of Manhattan Beach Blvd

The line turns southeast crossing Hawthorne Boulevard at $190^{\text {th }}$ Street. Both road crossings are at grade as the line enters the Honeywell/ExxonMobil/Union Carbide/Dow Chemical industrial complex south of $190^{\text {th }}$ Street between Hawthorne Boulevard and Western Avenue. Much of the lien follows right-of-way through residential neighborhoods.

BNSF Harbor Line at 167 St east of Inglewood Ave

The line continues southeast crossing Sepulveda Boulevard, Western Avenue, and Normandie Avenue before turning east paralleling Sepulveda Boulevard to Watson Yard and east to West Thenard Junction on the Alameda Corridor.

South of the industrial district, the BNSF line through Torrance and Carson has six grade crossings cited as causing significant vehicle delays or other problems. These grade crossings typically involve multiple traffic lanes and several are approached at oblique angles that may obscure sightlines.

BNSF Southern Section Grade Crossings Cited for Delays

BNSF Grade Crossing Torrance East of Crenshaw

BNSF Grade Crossing Arlington in Torrance

BNSF Grade Crossing Sepulveda West of Western

Harbor Line Crossing at Sepulveda Blvd

BNSF Grade Crossing Western South of Sepulveda

BNSF Grade Crossing Figueroa in Carson

The maximum train speed on the line is 20 mph with several permanent speed restrictions.

As noted earlier, the Harbor Subdivision formerly carried all Santa Fe traffic to and from the ports of Los Angeles and Long Beach, where it was interchanged with the former Harbor Belt Line, now PNL. After the opening of the Alameda Corridor, all the port container traffic and some other types of traffic as well shifted to the Alameda Corridor and off the Harbor Subdivision. The Harbor Subdivision is therefore now used exclusively for non-container traffic in conventional railroad freight cars.

BNSF has two trains serving the rail customers on the Harbor Sub Main Line. One starts at 6:30 AM the other starts at 2:30 PM, both originate at Watson Yard and work north, and both serve the industrial complex in Torrance.

The morning train also serves rail customers north of the complex. This morning train serves the Chevron Refinery and Learned Lumber in El Segundo on Douglas Street. This is the furthest north of any active rail customers on the Harbor Line.

The only train activity north of this point is for staging empty double stack cars for the ports. There are three locations on the Harbor Line of adequate length (approximately $5,000 \mathrm{ft}$ or more) where double stack trains can be staged without interfering with operations. The furthest north is adjacent to LAX between Arbor Vitae Street and Imperial Highway ( $7,500 \mathrm{ft}$ ). The next south location is between $190^{\text {th }}$ Street and Crenshaw Boulevard ( $9,200 \mathrm{ft}$ ) and the closet to the ports between Western Avenue and Normandie Avenue ( $4,200 \mathrm{ft}$ ). If BNSF had an alternative location to efficiently stage empty double stack trains for the ports they would not have to operate beyond the line into Learned Lumber and Chevron thus eliminating the grade crossing issue at Imperial Highway.

Railcars to and from the customers on the Harbor Line as well as cars to and from PHL are handled to and from Watson Yard on a daily train from Barstow on the Alameda Corridor. In addition to that train and the intermodal trains from on-dock terminals there are three to four tank trains of ethanol per week with 96 to115 tank cars per train that are delivered to the recently opened tank car transfer facility at the north end on Watson Yard.

Ethanol Tank Train Transfer Facility at Watson Yard

## Appendix F: Travel Demand Forecasting Model Development

The travel demand forecasting (TDF) model used for the South Bay Cities Council of Governments (SBCCG) Goods Movement Study is a hybrid model based on SCAG regional model and the Ports of Long Beach (POLB) and Los Angeles (POLA) Transportation Study model. The Port model was developed in 2001 and was approved by Ports of Long Beach and Los Angeles for Port area Transportation Planning Studies and environmental studies

For the purpose of this study, the SCAG model used for the 2004 Region Transportation Plan (RTP) was updated by adding the Ports truck trips to the regional trip tables. The 2000 and 2030 Port truck trips for the four (AM, Mid-day, PM and night time) periods were developed using the Ports TDF model. The port truck trips tables were then aggregated back to the SCAG zones system where the Ports of Long Beach and Los Angeles are represented as three zones. The port trip tables were kept separate from the SCAG heavy duty truck (HDT) trips in order to differentiate the port truck trips from other truck trips in the model. Special model features include the following:

Grades and Passenger Car Equivalents - An important feature of the SCAG model, which was explicitly accounted for and coded to the network, are locations of steep uphill and downhill grades. Grades are coded in the network as they are in the field, to an accuracy of one percent.

Implementation of Truck Passenger Car Equivalencies (PCEs) - The presence of vehicles other than passenger cars in the traffic stream affects traffic flow in two ways: (1) these vehicles, which are much larger than passenger cars, occupy more roadway space (and capacity) than individual passenger cars, (2) the operational capabilities of these vehicles, including acceleration, deceleration and maintenance of speed, are generally inferior to passenger cars and result in formation of large gaps in the traffic stream that reduce the highway capacity. On long, sustained grades, and segments with impaired capacities, where trucks operate considerably slower, formation of these large gaps can have a profound impact on the traffic stream.

The model uses an equilibrium traffic assignment method, which uses a PCE table for converting port and other regional trucks to equivalent passenger cars. They include a sliding scale of PCE factors that takes into account the grade, the length of grade and the percent truck traffic.

Port Truck Trip Tables - The port model zone trip tables were developed based on a detailed port area zone system and specialized trip generation rates for autos and trucks in the Ports. Special trip generation rates for autos were developed for the Port studies and applied to the most current 2030 Port forecasts. Port cargo throughout is measured in terms of "twenty foot equivalent units" (TEU). Truck trip generation for container terminals was developed using the "Quicktrip" model as explained later in this section.
The Quicktrip model is a spreadsheet approach to truck trip generation analysis that was developed as a collaborative effort between the staff of both Ports and a team of consultants. The model builds upon a gate trip generation
model that was previously developed, with considerable refinements. It includes detailed input variables such as mode split (rail versus truck moves), time of day factoring, weekend moves, empty return factors and other characteristics that affect the numbers of trucks through the gates. The end product is a forecast of truck trip generation, by type of truck trip, for each hour of the day, by direction. The on-dock rail mode split will vary terminal by terminal base on each terminal's rail capacity. For the POLB the average on-dock rail mode share is $24 \%$ for the POLA it is $29 \%$

The Port area peak hour auto, bobtail, chassis and container trip tables were generated based on the forecast 2030 twenty-foot equivalent units (TEU) using the Quicktrip model. The total estimated TEU throughput for 2030 for both ports is approximately 44.7 million TEU. For the peak month, this equates to 4.1 million TEU. As a comparison, the total ports TEU throughput was determined to be 11.8 million in 2003. Truck trips are classified into bobtail, chassis and container truck trips, representing the major types of truck trips in the ports.

## MODEL NETWORK OF STREETS AND FREEWAYS

The model network used in the SCAG Regional Model is used for the base-case 2030 projections. That network includes the extension of the I-710 to the I-210 and separate truck lanes from the I-710 on Rte 60 to provide connections easterly to the I-15. It also includes other "smaller" truck-related network features.

In summary, the following lists the key specifications/elements for the TDF traffic model:

- Model produces years 2000 and 2030 daily forecast traffic volumes.
- Model contains specialized trip tables for the Ports area, which replaced the SCAG model Port trips in the port area.
- Model includes the 2004 RTP auto and heavy-duty truck (HDT) trip tables
- Model initially uses SCAG network which includes truck lanes on I-710 to SR 60 and then on SR 60 easterly to connections to the SR 57 and I-15

Changes to the model network which were used in the evaluations in this work are described in the following section.

## SPECIFIC MODEL RUNS FOR THE SOUTH BAY GOODS MOVEMENT STUDY

With the addition of the Port truck trip refinements to the SCAG Regional model, MMA conducted a 2030 model run with a focus on truck traffic patterns. To develop the Port truck trips, it was assumed that about 60\% of the Port truck traffic travels during the day and $20 \%$ in each of the evening, and Hoot (late night) periods. The changes in each of the different mode runs relate to changes to the roadway/ freeway network.

For the purpose of this study, the study area was defined by the coastline on the South and West, the Inglewood city limits on the North, and the Inglewood, Hawthorne, Gardena, Carson, Rancho Dominguez (unincorporated), and Los Angeles (Wilmington) city limits on the East. This window area provides the ability to define future volumes as they relate to trucks and all vehicles for the I-110 and I-405 freeways and the connecting freeways. Model Runs were conducted for the following scenarios:

- 2000 Base Year Model - SCAG 2000 Base Year model was validated for the study area. The key validation was incorporation of the time delays for representing the ramp metering at the I-105/I-605 and I-105/I-710 interchanges.
- 2030 Baseline RTP - the SCAG 2030 Plan highway network (which includes truck lanes on I-710 and SR-60 freeways) was updated as follows:

1. Incorporating the I-710 Locally Preferred Alternative design.
2. Elimination of the connection of the I-710 to I-210.
3. As part of the 2000 base year model validation, additional time delays were added in the model to reflect the ramp metering at l-105.

## DATA LIMITATIONS

Regional travel demand models are powerful tools that allow one to analyze future conditions and help aid decisions about investments based on future travel demand. However, like all models, the limitations of the travel demand model used for this study are present.

These specific limitations to the outputs of the transportation model should be taken into account when analyzing the data:

- Trips are assigned to highest capacity roadways, which may undercount volumes that would take lower capacity roadways that serve large trip generators
- Inability to directly compare the change in volume on a roadway link in different scenarios if that link has been changed. When a roadway improvement is coded into the transportation network, new nodes are assigned to the roadway. Examples of this are the 105 ramps at Crenshaw Blvd. and the I-405 ramps at Del Amo Blvd.

## Appendix G: City Staff Survey Sample

December 5, 2006
To: South Bay Cities City Managers, city planners, and city engineers
RE: South Bay Goods Movement Survey - 2006
The South Bay Cities Council of Governments (SBCCOG) is sponsoring a goods movement study for the South Bay Cities, and requests your assistance in completing this survey -an update of the 1999 South Bay Cities Trucking Study survey.

Your city participated in the prior survey effort and provided the SBCCOG with a filled out survey. At this time, we want to revisit and update the responses, since there has been growth in goods movement, port activity, LAX usage, and general industrial/distribution activities in the South Bay. A shortened version of the survey (questions pertaining to community impacts) is also being sent to your city council members so that their perceptions and concerns can be included.

Please circulate this survey to the appropriate persons in your jurisdiction. This file can be edited directly and returned by e-mail or printed out, edited, and returned by mail or fax.

Call Sean Daly (562-432-8484 x27) at Meyer, Mohaddes Associates (the project consultant) or Kim Fuentes (626-357-4445) at SBCCOG with any questions regarding the update of the survey or the study effort. Your assistance with this survey will help SBCCOG develop plans to address goods movement issues and allow South Bay Cities to better compete for goods movement funding.

Please return these materials by January 19, 2007.

| Retail/Big Box <br> Stores |  |  |  |  |
| Other: |  |  |  |  |
| Other: |  |  |  |  |

2) Rank trucking-related impacts in your jurisdiction
( 1 = no problem, 3 = moderate problem, $5=$ severe problem)

| Truck-Related Impact | Severity Rank <br> ( 1 = no problem, 3 = moderate problem, 5 <br> = severe problem) |  |
| :---: | :---: | :---: |
|  | 1999 Rank | 2006 Rank |
| Congestion Due to Trucks |  |  |
| Neighborhood Intrusion of Trucks |  |  |
| Truck Parking |  |  |
| Truck Traffic Safety |  |  |
| Street Deterioration Due to Trucks |  |  |
| Hazardous Materials |  |  |
| Truck Noise |  |  |
| Truck Air Pollution |  |  |
| Other: |  |  |

2.a) Is your city experiencing problems on arterial streets due to truck movements?

If so, please define the problems and/or attach a map.
2.b) Are there intersections experiencing problems related to excessive truck traffic or truck movements?
If yes, please define the problems:
2.c) Are there other trucking-related problems in your jurisdiction? (e.g. cut-through truck traffic in residential areas, on-street loading problems, off-street access, etc. If so, please describe:
3) Does your jurisdiction have a designated truck route system? If yes, please attach a map of system.
4) Does your jurisdiction have truck-related ordinances and/or other regulations? If yes, please attach a copy.
5) Are trucks prohibited on specific streets? If yes, please list streets and/or attach map. Define restrictions - by hour, tonnage, \# axles, etc.
6) Truck traffic counts will be taken for this study. Please recommend streets and specific locations in your jurisdiction which would be appropriate for truck counts. Please list locations and/or attach map.
7) Are there at-grade freight rail crossings which create significant motorist delay? If yes, please list the problem locations and/or attach map.
8) Do any freight rail lines cause significant noise or air quality problems? If yes, please note where the problems occur and/or attach map.
9) Are there any specific goods movement-related issues you would like studied as part of this project? Please list.
10) Are there any residential or business groups in your city who have been actively addressing problems relating to truck or goods movement issues?
11) If you would like us to contact any of these people/groups who might provide additional information regarding truck movements or issues, please list those contacts.
12) Has your jurisdiction noticed a difference in trucking patterns due to the implementation of the Pier PASS off-peak hours program at the Port of Los Angeles and Port of Long Beach?
13) Please attach copies of any other related data you have that will help identify problems and issues in your jurisdiction (e.g., traffic studies, truck traffic counts, General Plan elements.)

## Appendix H: Focus Group Summary

## MEMORANDUM

TO: Jacki Bacharach
FROM: Sean Daly
CC: Gary Hamrick, Meyer, Mohaddes Associates
DATE: April 30, 2007
SUBJECT: Issues covered in the South Bay Goods Movement Focus Group
J/P NUMBER: J06-9002

A Focus Group for the South Bay Goods Movement Study was convened on April 17, 2007 with the following attendees:
o Roland Talton, Inglewood/Airport Area Chamber of Commerce
o Jennifer Johnson, Watson Land Company
o Patty Senecal, Transport Express, International Warehouse Logistics Association
o Sean Daly, Iteris, Inc.
The issues covered in the focus group were as follows:

## Inglewood Issues

A concern of the Inglewood/Airport Area Chamber of Commerce is the general condition and maintenance of streets that serve the most truck traffic in the City of Inglewood: Century Blvd. and Imperial Highway, followed by Manchester Blvd. and Florence Ave. Many of these truck trips travel between LAX and warehouses in Inglewood. Roadway repairs are slow, if the come at all. The State is in agreement with the City of Inglewood to maintain Century Blvd. but the repairs to this street do not necessarily occur faster than to other streets in the City.

## General Geometric Issues

Left-turn lane timings are too short; signals should be timed to allow time for long vehicles to turn and prevent autos from following the left-turning trucks after the light has changed out of frustration. Adjustments can be different according to the time of day and length of vehicle in the turn lane. In general, road sensors should be configured to accommodate large vehicles.

## Dynamics of South Bay Goods Movement

South Bay has two sets of freight users, those serving the airport and seaport, and they have different needs.

## Warehousing Trends

Large-scale, mega-industrial warehouse development is going on in Ontario/Chino. Both construction and land are cheaper, but employee access and distance from ports is a major issue. It continues to be very desirable to be near the ports for warehousing and distribution. As on-site LAX warehousing is built-out, many are moving south of the airport, off-site to Inglewood, Hawthorne, Torrance, and Carson.

## Rail Trends

Rail spurs to industrial areas not used for South Bay goods, only bulk users. The major freight trends favor a movement to intermodal.

## Areas of Congestion

The group talked about general congestion issues while pointing out the following areas in specific:
o I-405 between Avalon and Del Amo Blvd. (both congestion and access issues)
o Northbound off ramps at Wilmington (programmed)
J. Johnson said that Watson Land Company was hearing complaints by residents that trucks were using Central Avenue in Carson, but Watson could not determine the cause-it was not one of their tenants.

## Truck Parking

Truck parking a big issue in South Bay, no public truck parking facility to turn engine off.

## Coordination with Other Subregions

Coordinate with Gateway Cities ITS efforts for goods movement.

## Truck Fees for Infrastructure Improvements

Some truckers are in favor of fees for truck exclusive facilities if they are part of an interconnected system: not just moving the bottleneck to another location.

Truck Signage and Wayfinding
Better signage and lighting is needed, especially around ports. Many truckers complain about finding addresses.

## Follow-up

Ms. Johnson from the Watson Land Group is willing to set up a meeting with two or three of their tenants in the near future. In addition, Lupe Valdez, the Director of Public Policy and Community Affairs for the Union Pacific is interested in future discussions.

## Appendix I: Truck Traffic Counts

As part of this study, traffic counts of autos and trucks were taken at fifteen locations in the South Bay on Thursday, April 12 for the midday and PM peak periods. The truck count locations were based on outreach to the South Bay Cities through surveys and meetings. City staff requested specific locations to be counted.

As the data shows, within the South Bay the midday peak period has more truck activity, both in absolute terms and as a percentage of total traffic, than the PM peak period. However, this is not true for all locations counted. Alameda Street in Carson and El Segundo Boulevard in Hawthorne had higher truck volumes in the PM peak hour, indicated that truck patterns vary depending on location, most likely due to varied operating practices of different industry segments.

| City | Location | Midday Peak 1PM - 3PM |  |  | PM Peak 4PM - 6PM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Truck | Total Vehicles | Percent | Truck | Total Vehicles | Percent |
| Carson | Alameda Street n/o Carson Street | 623 | 1,905 | 32.7\% | 774 | 3,457 | 22.4\% |
| Carson | Wilmington n/o Carson Street | 550 | 2,717 | 20.2\% | 385 | 3,620 | 10.6\% |
| Carson | Figueroa n/o 223rd Street | 125 | 2,432 | 5.1\% | 83 | 2,846 | 2.9\% |
| Carson | Avalon s/o University Drive | 148 | 3,971 | 3.7\% | 96 | 5,589 | 1.7\% |
| El Segundo | El Segundo Boulevard w/o Aviation | 147 | 2,911 | 5.0\% | 89 | 3,917 | 2.3\% |
| El Segundo | Sepulveda s/o Imperial Highway | 347 | 8,436 | 4.1\% | 177 | 11,290 | 1.6\% |
| Gardena | Rosecrans w/o Normandie | 339 | 4,649 | 7.3\% | 232 | 5,903 | 3.9\% |
| Gardena | Artesia Boulevard w/o Normandie | 310 | 5,455 | 5.7\% | 213 | 7,249 | 2.9\% |
| Hawthorne | El Segundo Blvd w/o Crenshaw Blvd | 281 | 3,691 | 7.6\% | 416 | 5,121 | 8.1\% |
| Los Angeles County | Sepulveda Boulevard w/o Vermont Ave. | 230 | 5,806 | 4.0\% | 103 | 6,773 | 1.5\% |
| Manhattan Beach | Sepulveda n/o Manhattan Beach Blvd. | 137 | 6,735 | 2.0\% | 63 | 8,294 | 0.8\% |
| Redondo Beach | Artesia Boulevard w/o Inglewood Avenue | 145 | 4,477 | 3.2\% | 123 | 4,936 | 2.5\% |
| Redondo Beach | Inglewood Ave. n/o Manhattan Beach Blvd. | 180 | 6,595 | 2.7\% | 105 | 7,392 | 1.4\% |
| Torrance | 190th e/o Crenshaw Boulevard | 173 | 4,377 | 4.0\% | 113 | 5,830 | 1.9\% |
| Torrance | Torrance Boulevard w/o Hawthorne Blvd. | 121 | 5,892 | 2.1\% | 63 | 6,164 | 1.0\% |
|  | Average | 257 | 4,670 | 5.5\% | 202 | 5,892 | 3.4\% |
